

Subject of my baccalaureate IS acute necrotic pancreatitis which IS on increase in the Czech republic. Incidence of the disease features 5- 20 on hundred thousand inhabitants.

The work is divided in two parts: clinical and nursing ..

The clinical part deals with anatomy, physiology, characteristics of acute pancreatitis, investigative methods and its treatment.

Nursing part includes care of 67 years old woman with acute necrotic pancreatitis. I used the Virginia Henderson's method in nursing process.

I hope this work to be helpful not only for nursing staff who take care of these patients.
