

The topic of his thesis disease of the external genitals, precancerous and malignant tumors have I chosen based on their interest in gynecological issues.

Malignant tumors are among the most serious lesions of the vulva. It is a relatively "rare" disease are diagnosed each year 165 to 180 cases. Incidence ZN vulva after years in the Czech Republic

stationary and moving between 3 - 4/100 000

Low morbidity, however, is followed by a high mortality rate (1.5 - 2), which is associated with a number of

factors. One of them is the high average age of patients who present with these tumors. U

These women often can not perform the corresponding radical treatment. Another reason is to determine

cancer at an advanced stage, when treatment is possible only palliative. This condition is due to the fact that the patient arrives at the gynecological examination too late.

More than 90% of malignant tumors based on the squamous epithelium. The following melanomas which occur in 4-8% of cases, and 1-2% are adenocarcinomas.
