

Abstract

Bachelor thesis called "Specifics of the educational process of pediatrics patients at younger school age" with focus on patient education in a specific developmental period. The thesis is divided into theoretical and empirical part. The theoretical part describes individual educational methodologies used in education of patients at younger school age. Moreover, it focuses on educational aids, participants of education, educational forms, specifics of the communication with patients and educational processes of patients, especially during their younger school age and developmental period of the child. The data for the empirical part were collected in two hospitals. In Motol in Prague and in hospital Lochotín located in Plzeň. The empirical part of the bachelor thesis characterizes methodology, material, organization of the research, processing of data, results of questionnaire, evaluation of hypothesis and educational observation as well. The outcome of the questionnaire survey is presented in bar graphs and tables. The established hypotheses are statistically elaborated below.
