

The topic of his thesis - Insulin resistance in pregnancy - I chose based on their long standing interest in issues of Diabetes and obstetrics. I was also inspired by the example of a personal life.

This is a rather broad topic in terms of accumulated medical evidence. A very significant in their societal and socio-economic consequences , as described below .

The topic is highly multidisciplinary and extends into the field of diabetology , gynecology and obstetrics , neonatology , etc. In their clinical consequences and medical - preventive care requires this combined approach and the participation and cooperation of the entire medical team with specialized theoretical knowledge and practical experience. There is great scope for preventive measures.

Epidemiology clinical consequences of insulin resistance in pregnancy is developed in Chap. 6 (clinical implications ) . Incidence, prevalence and incidence of diseases associated with insulin resistance is ( in our country and around the Euro - American world ) is still on the rise.

This thesis (as described in the next chapter ) deals with mapping issues , clinical implications and possibilities of prevention.
