

As a topic for her thesis I chose premature rupture of amniotic fluid, because this topic is obstetric constant current research and studies in both risk factors, new diagnostic methods, and novel therapeutic approaches.

Premature rupture of membranes must be kept in mind during the duration throughout pregnancy until delivery by the due date, as may occur in any of its phases. Immediately there is a threat to the further course of pregnancy, the fetus and the mother's life. Approximately 30% of the cause of premature childbirth and thus contributes significantly to perinatal and infant morbidity and mortality.

In my work I have therefore decided to complete currently valid and the clinical use of knowledge relating to the issue and to both in terms of etiology, risk factors, appropriate treatments adding to it the newest and compare them with the knowledge foreign to

Based on studies relating mainly to some diagnostic and therapeutic methods and their use.
