

Abstract

Theoretical part of this thesis deals with following topics: locus of control, gestational diabetes and health-related behavior. Research project examines differences in locus of control between two groups of pregnant women, one group without gestational diabetes diagnosis and other group with gestational diabetes diagnosis. Furthermore this part of the thesis examines differences in locus of control between two groups of pregnant women, one group with gestational diabetes with mild risk and the other group with gestational diabetes with higher risk. Last examined difference is in locus of control among women with gestational diabetes before receiving diagnosis and after receiving diagnosis. Proposed project can be useful for professionals working with women with gestational diabetes.
