

Abstract

The diploma thesis deals with the history of the production of medicines and medicinal products, the company of Zdeněk Klan and a partial inventory of specialties. The aim of the thesis was to map the time, which was characterized by the industrial production of drugs and medicines, the so-called specialties. Zdeněk Klan was able to take advantage of the situation and build his own company *Dr. Mr. Zdeněk F. Klan pharmaceutical-chemical laboratory*, operating in the years 1924–1948. He was able to compete with other companies with his products. The production was focused mainly on application forms for internal medicine. In addition to human preparations, he also produced preparations for veterinary use.

The Klan Company succumbed to the process of nationalization in 1948, when all companies with more than 50 employees were nationalized and subsequently abolished. On the basis of the study of mainly archival sources stored in the Czech Pharmaceutical Museum in Kuks, a thesis was prepared describing this company from its establishment to nationalization. His CV was also prepared.

In addition to processing information about Klan's company, the task was to invent a part of the collection of specialties and thus make it available for subsequent museum-research use through the resulting inventory. These were obtained from stocks of medicines intended for inventory. Each medicinal product was assigned by an inventory number, a name, image documentation was taken, and it was processed in detail from the amount / dose through the application form, indication to the registration number. All this data is stored in an electronic database called Bach ProMuzeum, in which all this information can be filtered and searched as needed.
