

## **Abstract**

Christians in cyberspace. The aim of this work is to find an answer to the question of whether it is possible to use cyberspace safely and for good, or whether cyberspace itself is bad and its use incorrect.

The first part of the work is devoted to the rapid technological development of recent decades in general. The first chapter defines the concept of cyberspace. The second chapter will summarize the development of technologies related to cyberspace, mainly telecommunications technologies. The next chapters look at how this change and the spread of technology has changed the way people communicate, and describe the most important changes, both positive and negative.

The second part of the work tries to introduce to the specific worlds of the inhabitants of cyberspace, to the communities that have emerged around the new technologies with different goals. At the same time, specific examples were selected, in which new facts can be seen in some way, which were previously not available at all, or only to a limited extent.

The last, third part is then the core of this work, to which the first two parts lead. It first describes how the already mentioned development of technologies and changes in the style of communication affect the individual, what are the benefits and consequences for him, and finally summarizes what the teachings of the Church say about this new situation.
