

The aim of this thesis is to make readers acquainted with not very known Crohn's disease. The work is divided into two parts – theoretical and practical. The first one describes the alimentary tract anatomy and physiology. Therein after, it renders non specific intestinal inflammations, their representatives, the definition and history of the Crohn's disease. It also deals the causation of the disease, its process, symptoms, complications, diagnostic and treatment. The theoretical part includes an association of people suffering from Crohn's disease, Crocodile (CROhn and Colitis DILEtants). The second part, the practical one, includes the nurse procedure on which the nurse anamneses are based. It also covers the M. Gordonová model that was the basis for the patient anamnesis. The hospitalization process is present in the practical part. In the thesis supplement there are additional information about the association, evaluative scales tables and nurse anamnesis which I filled up along with the patient within the scope of my nurse care.
