

I wrote my bachelor's work on theme: Care process about patient before and after thyroid surgery. I split my work to two parts. In the first theoretical part I write about anatomy, physiology, characteristic of illness and examinations leading to the diagnostic and treatment. In the second practical part I write about care process of particular patient with thyroid disease. I cared of that patient at ORL department, where the thyroid was exenterated to her. During the hospitalization I made a nurse anamnesis which is based on Majory Gordon's nurse model of Function health. Thanks to my obtained information from medical documentation, patient and other medical staff, I analyzed all troubles and made nurse anamnesis, to which I attached nurse care plan, realization of that plan and evaluation of nurse interventions. The end of my work belongs to education and prognosis of patient. Education target was to inform patient about post-operative recovery, adherence to medical and nurse advices, to give a sufficient information about after-effects and answer all patient's questions, what I could.
