

Abstract

This bachelor thesis deals with the issue of domestic violence in connection with the intergenerational transmission of aggressive behaviour. The aim of this work is to test the hypotheses on data from Pilot Survey of Students from 2018.

The first part of the thesis presents theories that explain the origin or reproduction of domestic violence. In addition to the theory of intergenerational transmission, it is, for example, the theory of social learning, which is often cited together with the above-mentioned theory. I also deal with methodological aspects and specifications of Pilot Survey of Students from 2018. In this part of the work also set of hypotheses for subsequent analysis is formulated.

In the analytical part, the results of the analyzes are presented, their interpretation and hypotheses tested, the validity of which was confirmed through secondary data analysis. The conclusions from the conducted research thus confirmed the validity of the main thesis of my bachelor's thesis: "The intergenerational transmission of aggressive behavior has an effect on the reproduction of domestic violence".

Key words: domestic violence, aggressive behavior, intergenerational transmission
