Abstract

The main goal of this study is to capture and analyze the dynamics of the transformation of party unity within political parties, which have split as a result of the ongoing internal party crisis. Emphasis is placed on the identification of internal dividing lines using data on parliamentary votes. The study is based on quantitative methods, relies on approaches and tools used in network analysis, and from a theoretical perspective it draws from the literature related to party unity, etc. Party unity was approached as a quantity that serves as a proxy for possible relationships within the analyzed parliamentary groups, whereas the degree of consensus voting (ie party unity) indicates relationships such as cooperation or rivalry. The primary outcome of three studies dealing with unique cases of intra-party divisions in the modern history of the Czech Republic was the identification of the dynamics of joint voting between deputies who remained in the divided party and "renegades" who left that party and became part of new political entities.

Keywords

Political networks; Party unity; Fragmentation of parliamentary parties
