

# Handout for Thesis Defense

Thesis: *Where did people die? An international assessment of a potentially positive relationship between economic development and the severity of COVID-19 outbreaks.*

by Jean-Baptiste Marigo

## **(1) Importance.**

The COVID-19 crisis is a global pandemic with a heavy human and economic toll. Studying country level weaknesses to such an outbreak is crucial in order to:

- Identify the characteristics that make certain countries vulnerable to this type of pandemic shock, and their stakes for the future.
- Provide evidence and insights for policy design to correct these weaknesses, in anticipation of future crises.

## **(2) Problem formulation.**

It is widely accepted in the development economics literature that development increases a country's resilience to diseases. This relationship is questioned regarding a pandemic such as the COVID-19 one.

- There is a positive correlation between development indicators (using the HDI components) and COVID-19 severity (measured in deaths per million), with correlation coefficients around 0.46 to 0.71.
- My main hypothesis is that the pre-crisis characteristics of development are positive causal factors of COVID-19 severity at the country level.

## **(3) Methodology & Data.**

Bayesian Model Averaging (BMA) is a method that allows to include many candidate variables and test all possible linear regression specifications to solve the model uncertainty issue, and compute weighted coefficients.

- This study uses data from the Johns Hopkins University, the WHO, UN programs, and other databases.
- With respect to previous papers, this work uses actualised data and a larger sample, up to 159 countries on the 01/01/2020 – 30/10/2022 period.
- Eight different BMA settings are used as robustness tests, increasing the reliability of the conclusions.

## **(4) Contribution.**

- This thesis chooses an original perspective by trying to assess how country characteristics related to development acted as parameter of the severity of the pandemic, while the literature mainly focuses on the inverse relationship.
- The choice of a BMA approach that includes many candidate variables, the use of actualised data, and the careful choice of the temporal sequence of the predictors allow for the assessment of a causal relationship, beyond correlation. Thus, a reliable interpretation of the results can be made with respect to future policy recommendations.

## **(5) Response to Comments from Reviewers.** *Prepare careful answers to all comments raised in the reports.*

*This may take quite a lot of time at the defense.*

- *TBD when reports are available.*
