

Abstract

The bachelor thesis will deal with the educational process in the children's bone marrow transplant unit at the Motol University Hospital. The educational process takes place in 4 stages, where both the doctor, psychosocial worker, nurse, as well as the patient and his family participate in the educational process itself. The work will focus on specifying nursing care in this department and education within this educational process, where the nurse herself already participates in educating the patient and his family when the patient is admitted to the transplant unit. The bachelor thesis will be divided into a theoretical part and an empirical part. The theoretical part will describe basic concepts in education and educational process in general. Furthermore, there will be a chapter on topics of education specific to bone marrow transplant units. The conclusion of the theoretical part will be devoted to the topic of bone marrow transplantation. The empirical part will present the results of an anonymous questionnaire survey conducted at the Department of Pediatric Hematology and Oncology at Motol University Hospital. The aim of the bachelor thesis will be to determine the quality and satisfaction with the current state of education in bone marrow transplant units from the perspective of patient accompaniment who is admitted to the transplant unit together with their child. At the end of the bachelor thesis, the results of the questionnaire survey will be evaluated, which will be a benefit for creating a proposal to improve the current state of education.
