

The theme of my thesis Malignant neoplasm of prostate cancer in the CR (epidemiology, risk factors, trends and possibilities of prevention), I chose because of the seriousness and topicality of this issue and on the basis of its personal interest in this disease.

Malignant neoplasm of prostate cancer incidence in the CR is moved to 1st place in incidence of malignant tumors of the male population even before the lung and colorectal cancers.

Number of new cases reported in the CR continuously increasing trend. The disease is undoubtedly a very serious medical, social and economic problem not only in the CR, but also worldwide, which deserves a great deal attention. Although prostate cancer in recent years a significant shift leading to a fundamental change in clinical presentation, diagnostic algorithms and therapeutic strategies, unfortunately still many questions unanswered and this tumor has so far failed to get fully under control.
