

Occupational diseases include a heterogeneous disease, which combines strong socio-economic impact for the patient and society.

Monitoring the incidence of occupational diseases is an important indicator Population Health. Our duty is to spread awareness of possible consequences of non-work safety rules and most effective prevention to prevent any injuries from work.

In my thesis I intend to illuminate the issue of occupational diseases and their legislative definition and categorization according to the Section. The practical part will be devoted to monitoring trends in incidence of occupational diseases in the last ten years, and statistical comparisons Data of disease between men and women.
