

ABSTRACT

The diploma thesis deals with school and communicative projects with a focus on health and safety at elementary schools in the Pardubice region. The aim of this thesis is to find out whether the offer of projects or programs related to health and safety is sufficient, whether schools use these offered projects or if they prefer to create projects or programs themselves. Another goal of the thesis is to find out if the schools feel any lack of program topics or programs on the market and if so, which ones. The final goal of this work is to create an overview of externally offered projects and programs related to health and safety.

In the theoretical part are defined terms related to projects and programs focusing on health and safety questions of an individual, of their organization, and of realization at elementary school in the Pardubice region.

The practical part presents interviews with school leaders, expert teachers and with school operational staff.

In some interviews, the interviewed respondents mention interesting school projects that the respective schools have created themselves and that the projects proven successful in practice. The practical part also includes a list of projects and programs offered to schools in the Pardubice region. This list is divided into sections according to its focus.

The diploma thesis could be a help for schools to find faster schools and community projects and programs focused on health and safety, not only in elementary schools in the Pardubice region.
