

Abstract

The bachelor thesis is devoted to the topic of general atmospheric circulation and its teaching at secondary schools. The aim of the thesis is to research the teachers' approach to teaching this topic and to analyse textbooks and atlases that teachers can use in their teaching. Another objective is also to create teaching material that can facilitate teachers' preparation for classes dealing with the mentioned topic. In the first part of the thesis, the reader is introduced to the topic of general atmospheric circulation itself, a summary of previous research and a presentation of the view of the topic from the point of view of Czech educational documents. In the second part, both researches and their results are presented, i.e. the content analysis of textbooks and atlases and the questionnaire survey in which 63 grammar school teachers participated. On the basis of these researches, teaching material was created, which is the subject of the last part of the thesis.
