Abstract:

In my bachelor's thesis, I will focus on the topic of endometriosis and its impact on a woman's quality of life, pregnancy, and childbirth. Endometriosis is a gynecological condition characterized by the pathological presence of uterine lining, called endometrium, outside the uterine cavity. It can affect almost any organ in the human body, most commonly the adnexa or pelvic cavity. Ectopically located tissue is subject to cyclic hormonal changes and can form adhesions or cysts, which can be a source of severe pelvic pain. It is thus a chronic condition that affects a woman's daily life, especially her reproductive health.

My work will consist of two parts - theoretical and research. The aim of the theoretical part will be to briefly describe and summarize current basic knowledge related to endometriosis, including the definition of the condition, its causes, symptoms, basic classification, and subsequently diagnostic and therapeutic procedures. Lastly, I would mention the issue of conception in women with endometriosis and the impact of this disease on the quality of life.

In the second part of the thesis, I will conduct research based on available data regarding women diagnosed with endometriosis who have become pregnant and subsequently given birth. I will focus on the course of pregnancy and childbirth and any accompanying complications. I will attempt to compare women and determine the most common risks that occur in the peripartum period

Keywords: endometriosis, quality of life, infertility, getting pregnant, pregnancy, childbirth
