Keywords: uterus, cervix, precancers, HPV, cancer, prevention, vaccination, treatment, diagnostics, adolescents

This Bachelor's thesis is about awareness of cervical cancer prevention among high school youth.

In the theoretical part, we focused on epidemiology, uterus and cervix, prean-cervixes, carcinomas, treatment, diagnostics, prevention and in the context of prevention as well as vaccination, as well as periods of adolescence.

The empirical part is based on a non-standardized quantitative questionnaire investigation, by which we tried to get information about high school students' knowledge of cervical cancer and prevention of HPV infection. The group targeted by the questionnaire is therefore aged between 15 and 19. The selected respondents were students of 3 high schools.
