Title: Awareness female students of nursing school on breast cancer prevention

Supervisor: Mgr. Jana Matulová

Number of pages: 73

Number of attachments: 3

Year of defense: 2024

Keywords: breast cancer, prevention, diagnosis, breast self-examination, oncological treatment

The bachelor's thesis deals with the awareness of secondary medical school students about the prevention of breast cancer. The work is divided into 2 parts. On the theoretical and empirical part.

The theoretical part deals with the anatomy, vessels and nerves of the breast, breast development, risk factors, causes and symptoms of breast cancer. It also deals with diagnosis, treatment, prevention of breast cancer and, last but not least, the role of the nurse in the educational process.

The empirical part focuses on the analysis of the research investigation and comparing the results with previous university works on a similar topic. In the empirical part, we find out to what extent female students of secondary medical schools are informed about breast cancer prevention. The research was conducted at the secondary medical school in Trutnov with 1st and 4th year female students.

After the end of the research, the female students were given an informative leaflet about the symptoms of breast cancer.
