

Annotation

The thesis is divided into two parts – theoretical and practical. The theoretical part represents the concept, historical roots of research of this syndrome, characteristics, pathogenesis. It introduces also impacts of electrolyte disturbances (hypophosphataemia, hypokalaemia, hypomagnesaemia, hypokalcemia). The necessary component of the thesis is the occurrence indication, categorisation of risk groups of patients, monitoring, treatment (recovery), as well as prevention of the syndrome. Thesis includes also a part which presents open-ended and questionable issues related to RFS. The practical part then processes the data of 110 patients. For more information about the methodology and its processing in particular, see the methodology chapter.
