Abstract

Within the scope of the bachelor's thesis, I explore the issue of social inclusion of individuals with intellectual disabilities and examine how new technologies and applications can contribute to this process. The theoretical part of the thesis is based on understanding the issues related to intellectual disabilities, social services, and social integration. It also describes new technologies, applications, and innovations utilized in projects and examples of best practices. The empirical section adopts a qualitative research strategy, employing semi-structured interviews with caregivers, providing deeper insights into how technologies and applications assist with social integration and how caregivers perceive this issue.

Key words: social integration; intellectual disabilities; caregiver; technology and innovation
