

The target of my diploma work was state level of knowledges of nurses about MRSA, further on how nurses observe preventative measure at treating MRSA positive patient and whether they have good conditions for treating in their ward. I accomplished this research in two Prague's hospital in the ICU. I compiled questionnaire to obtain informations and I distributed it to 100 respondents. Recoverability was 76 %.

I determined four hypotheses (one was confirmed, one was confirmed partly and two were contradict).

I stated that nurses have average knowledges of nosocomial infections theory.

Majority of nurses thinks that they are good at observing barrier treatment care.
