

In my thesis, I worked a case study of a patient diagnosed with Cholelithiasis, who was hospitalized in gastroenterology department.

In part, the clinical anatomy of the gallbladder and bile ducts, characteristic Cholelithiasis methods of investigation in relation to Cholelithiasis and treatment options. Then I pointed out the patient identification data, medical history, examination and listing of drugs that a patient while hospitalized recently and the course of hospitalization.

During processing, I used the method of nursing process. With that, I identified the basic problems of the patient, which I was working with him in trying to best resolve.

The patient was hospitalized for nine days in the gastroenterology department because of dovyšetření cholelithiasis. Among the highest priorities were the pain and change eating habits. The final decision on future treatment should MRCP examination. Which were found gallstones in the gallbladder. For further treatment was recommended cholecystectomy, which will be adopted as planned in two months, the resting phase Cholelithiasis.
