

We can expect increased amount of stroke with lengthening of life and growth number of people in higher aged categories. These incidents mean not only health but also social and economical problem.

Neurological patients go to refreshment residence to the Krušné mountains. The biggest group is made up of patients after stroke, there are mainly young people after car accidents and other head injuries and I would like to mention people who were operated with a brain tumor. Health condition of these people is not without a deficit, no matter what it is – motorics or sensitivity failure, speech failure or some psychical problems.

It is necessary to provide them with a complex health care of multidisciplinary team from the beginning. We can reach visible progress if we combine the patient's active approach to his habilitation.
