

Abstract:

This review article tries to follow the main issue relevant in the discussion of air pollution in a broad perspective as possible. It should include the foundation of this topic as well as some of the latest studies. A technical presentation of some details regarding origin, types and measurements of the typical urban air pollutants is then followed by a more focus medical-oriented description of health aspects.

Elaboration is given on malignant disease recently claimed to be associated with air pollution exposure and this is presented as summary of few studies conducted over exposed population all over the world.
