

Cancer is one of the most serious problems of clinical medicine. At present, the cause of death of every fifth citizen of the CR and the incidence is rising. This civilization disease affects an extra lower age range.

Compared to the past, this is mainly due to the fundamentally different composition of food that contains a preponderance of sugars and fats, but also stress and contamination of environmental substances with carcinogenic effect. Unsuitable diet and carcinogens present in the water, air and food cause the forming jednolivých higher number of tumor cells than the natural organism. The immune system may be weakened by stress and pollutants, it is not able to adequately respond to this situation.

For the greatest amount of recovered material, I have most dealt with the issue of hepatocellular carcinoma and its relationship to hepatitis B an
