

This thesis is focused on mapping the problem of treatment vertebralgic syndrome in terms of rehabilitation procedures of patients with this problem in medical offices. I have focused on access of general practitioner, neurologist, orthopedist and rehabilitation physician, who most often meet this problem. The thesis is divided into theoretical and practical part. In the first part there is the concept of vertebralgic syndrome, its epidemiology, etiology and clinical picture. Then I focus on a clinical examination of the patient, and I present the definition and content of the various medical specialists. The practical part survey process that focuses on the real situation in physician's offices and is focused on finding the most frequent causes vertebralgic syndrome, how many patients each doctor visit, which is standard procedure for examination and treatment of what doctors usually indicate.
