

Because the immunization belongs among the most successful ways how to prevent infectious diseases, this thesis is specialized in finding out the level of parents' knowledge about the obligate and non – obligate childhood immunization. The thesis is based on the theoretical findings about the immunization and the results of research, which was made by asking the respondents to fulfil the questionnaire.

The results showed, that the parents are not looking for the information about childhood immunization very often. They rather rely on information heard from the paediatrist. That's why, we think paediatrists should offer a bigger amount of information to parents by giving them some specific contacts (websides, prospectus or brochures).
