

When creating this work I have watched several targets. The first of these was to bring malaria as a disease in all its forms and all consequences that come with this disease may experience a bear, with special focus on the description of agents, mode of transmission, clinical differences between images different types of malaria, treatment, and last but not least, to recall the importance of prevention and intervention measures to limit the spread of disease and number of infected. I tried to show in addition to the medical aspect and socio-economic problems of this page, because a high incidence worldwide Every year malaria affects a relatively large percentage of the economically active population, but also children, pregnant women and seniors. The costs of their treatment and prevention other diseases in order to reach billions of U.S. dollars.

In the second part, I paid particular attention to statistical data and the epidemiology of malaria in the last 28 years not only in Europe, special emphasis on the Czech Republic but also abroad. There is documented increase in imported malaria, mainly in Europe but also in other countries. Predominant increase in imports to countries where malaria has been eradicated. I tried thus proving that malaria is indeed a global problem that is either directly or indirectly may affect each of us
