

The theme of my thesis, Overview of fractures in leg trauma treated at the clinic during the winter months, I chose based on their interest in this issues. The issue of fracture in the foot is relatively complex and their frequent occurrence. The Orthopaedics - Traumatology Clinic University Hospital Vinohrady in Prague in the period from 01.12.2008 to 31.01.2009 126 patients treated with fracture in this area. This means that for every day of the period (including weekends), there were more than 2 cases. The aim of my study was to evaluate under what circumstances, at what age and what types of fractures occurred and how he was treated. Data for this study was continuously pumped from the records by treating physicians in the cards individual patients. I was given this data to treatment.
