

The aim of my dissertation case study nursing patient care after duodenopancreatectomy. The theme I chose because I work at the clinic, which specializes in operational solutions tumors pancreas, and patients from the whole country. For the purpose of processing a case study I selected patients, Mrs. M.Č. (78 year), which was adopted at the surgical clinic University Hospital for a planned performance for pancreatic head tumor. The work consists of two parts - a clinical and nursing - divided into several chapters. The clinical part deals with anatomy and physiology of the pancreas abdominal pathology of tumors, their diagnosis, staging and treatment. Furthermore, present Basic data of patients, ie the identification data and medical history, date and reason for admission and place of hospitalization. Continuing medical history and diagnosis, during hospitalization, diagnostic, surgical and description the antiretroviral treatment. Nursing part is processed using the method of nursing Process. All information about patients, obtained from herself, her surroundings, from medical records and his own observation, I noticed the forms used in the Surgical Clinic in Prague Vinohrady Teaching Hospital (Annex 2). To the information gathered at 1 am postoperative day established nursing diagnosis, which I have individually developed goals and a plan of nursing care, followed by a description of the implementation of established interventions and their evaluation efficiency. In the nursing section, I included a chapter devoted to psychology and sociology and education of patients. In the end I present the general prognosis disease and the prognosis of patients.
