

In my thesis I am writing about a patient with diagnosis diabetes mellitus 2nd type, who was hospitalized in internal departments for the overall deterioration and decompensation of the disease. I cared about the patient during my practice, on above-mentioned department. The aim of this paper is case study in a patient with diabetes mellitus, 2nd type.

In the clinical part of my work I deals with the history, characteristics, anatomy and physiology of diabetes mellitus. His clinical picture, diagnostic tests, therapeutic procedures. Describe acute and chronic complications of this disease.

The nursing part of my job I deal with a patient and use the methods of the nursing process. In gathering information and assessing the patient come out of the model Marjory Gordon. Substantial information was recorded in nursing documentation, which I put as part of my work. Analyzing all the information gathered, I have established the current nursing issues and to identify nursing diagnoses that I have lined up according to the importance of the solution. For each diagnosis, I also drew up a plan of nursing care interventions with the implementation and evaluation activities. At the end of my work I deals with the psychology of the patient and educationalists. The whole work concludes review of the literature and attachments.
