

In this bachelor thesis is described a risk of injury at work in a health care.

This thesis describes the relationship of work and health, which provides various kinds of harm from the work. Other chapters are devoted to risk most frequent injury in the medical and biological factor, dermatosis, physical and psychological stress. A separate chapter consists of preventive measures and legislation on occupational health.

To determine the trend in occupational diseases in the health care is given time period from 2005 to 2009, the results are arranged in charts, which are created in MS Office Excel 2003. Data are obtained from an online registry of occupational diseases of the State Health Institute.
