The present work describes the results of processing the excavations obtained during the research of habitation at a Stroke-ornamented ware culture in Jaroměř (Náchod county). The inner chronology of the habitation was studied using spatial relation analysis and the study of the ceramic collection. Through the study of the stone tools, the habitation was set within the wider distribution relationships of the region and it was also possible to observe the manufacturing activity in the researched location. With the help of the ceramic remains, three residential phases were identified which correspond with the shift between the older and the younger degree of culture. This chronology also corresponds with the changing building tradition of the houses of the habitation. The existence of an independent manufacturing region was not proved. The present study looks at the form of the pottery at an important time when the Lengyel influence started to permeate from Moravia to Bohemia.
