

Abstract

The aim of the thesis was to analyze the importance and the position of German elders within the state and the society. The reasons for ageing of the population in the above mentioned society were described clearly. Later there was discussed negative influence of this demographic phenomenon on the society and the social system. The author tried to look for the measures to solve this issue and explore their acceptability.

Here we can see that the elders are not only one important part of the state and society but it is necessary to solve individual troubles of this social group as well, mainly their diseases and fears. This should lead to better understanding of the elderly generation.

The thesis supposes not only to pick up and analyze the results in the group of 300 elders in Munich. Obtained results will be utilized in confrontation with similar analyses performed in Prague, maybe in Hradec Králové. This way it would be possible to show the differences between examined groups and give the outcomes to formulate general projects in order to improve the pharmacotherapy in the elders. As real needs of the elderly are a little bit neglected in our modern and quickly living society, the author believes to have succeeded in the support for better understanding in the field of needs of the elderly generation - an important group of inhabitants.
