

I deal with issue of nursing care of the patient with implantable cardioverter – defibrillator in a case study. The patient was hospitalized on 25. 11.2013 with a ventricular fibrillation with an unconsciousness. The paramedic performed heart massage and the patient was repeatedly defibrillated. Then the patient was transported to a catheterization laboratory for a checking coronary artery. The doctor implanted the patient the cardioverter defibrillator because of ventricular fibrillation. The implantation was without the complications. The hospitalization was finished the eighth day. The patient was informed about next control. The patient was hospitalized for perfect cooperation. The patient was in the care of doctors and nursing team satisfied. List of abbreviations, list of literature and others are in the end of my thesis.
