

## **Abstract**

The dissertation inquires to the contention of the good with the good - sports and recreational activities in the protected area. I have set three ambits of research questins: Who? What? How to deal? to get the solution of the reasearch task 'The Analysis of the Conflict of Interests between the Protection of Nature and Sports and Recreational activities (cycling and cross country skiing). I am trying to find main representatives in the concrete area and describe the conflicts among them. Next I have presented the problems of doing sport in the protected area. Firstly I am focused on the way of the negotiation about the use of the Jizera Mountains Protected Landscape Area and secondly I am trying to find the existence of the common future goals in the area development. With the help of the actor analysis I have tried to answer the research questions. I have used the analysis as a pattern how to look at the problems and how to deal with the facts acquired with the help of semistructured interview. As a result I have found that the main problem in the Jizera Mountains Protected Landscape Area is mainly the intensity of described activities. The ascertainment of the density of high-quality relationships confirms strong social resources. Within the participation a lot of relationships allowing the cooperation were discovered. All representatives mostly respect each other. As a result they reach the agreements focused on the use of the mountains for sports activities based on the time and space differentiation.
