

The topic of his thesis , A survey of patients treated for fractures in the proximal humerus in 2005 I chose based on your interests the field of orthopedics and traumatology .

Fractures of the proximal humerus are among the four most common fracture. In 2005, the Department of Orthopaedics - Traumatology Clinic FNKV treated a total of 224 cases of these fractures. While the treatment of stable and minimally displaced fractures is quite unproblematic and can handle and conservative treatment of unstable , vícefragmentových and fracture-dislocations is complicated and still not fully resolved traumatology .

The aim of this work was to evaluate patients treated at the Orthopedic - Traumatology Clinic FNKV for fractures of the proximal humerus in 2005.

I started out a questionnaire that was completed by the attending physician for each fracture separately. The questionnaire asked for age and sex of the patient , the circumstances of the accident, type fracture, method of treatment , indications and types of operations
