

The topic of his thesis "The yield of preventive examinations in surgery practitioner for adults in prevention of colorectal cancer "

I chose based on the seriousness of this issue, and therefore the estimated High probability with which this problem will meet in their further exposure to the medical field, anticipated surgery. My selection partly due to several weeks of practice and the department of surgery at the hospital Sisters of Mercy of St.. Charles Borromeo Petrin hill in Prague, where I could stand by and assist at several operations for colorectal cancer under leadership of head physician. Sequens, PhD. To me again revealed in complexity of the whole issue and the need for early preventive measures such as the above-mentioned preventive examinations in general practitioner doctor

The incidence and the mortality rate for colorectal cancer include the Czech Republic compared to the sad world firsts. More precisely, the relative first mortality in men and second in women (1995). Another alarming fact is the fact that mortality from this neoplasm is increasing (for both women and men). Since 1970 to 1995 increased mortality from colorectal cancer in the Czech Republic 61% for men and almost 44% in women. It is therefore very important research within identify risk factors for the development of malignant neoplasms and subsequent implementation of prevention programs and measures for the early detection, which, as demonstrated already established preventive procedures, reduces mortality
