

This diploma thesis attends to the landscape character, the methodics of the evaluation of landscape character and the influence of mining on the landscape character. Příbram, influenced by uranium mining during last century, was chosen as a model area. The aim of this thesis is a comparison of chosen methodics of the evaluation of landscape character in the term of mining district and a creation of new methodics specialized for model area. The thesis focus on the landscape character and restoration ecology in mining areas in theoretical part. There is a description of landscape character protection and preservation, also in terms of law, reclamations and uranium mining. Below, the four chosen methodics are mentioned. In practical part, the diploma thesis characterizes the model area, its history and also current situation including reclamation made. Then there are a comparison of chosen methodics of landscape character evaluation according to elected criteria and a project of methodics for to a evaluation of chosen area.
