Abstract

Man is a part of the landscape and in permanent interaction with it. Almost each our activity has more or less impact on the landscape and the place where we live. For centuries we have been transforming the landscape to our own image, and therefore the scenarios of the possible development which I am trying to predict, are to show how such a place could or should be changed in the years to come. In the last years man has eventually begun to realise that his impact on the landscape can have catastrofic consequences and that those scenarios are very good impuls for the town, which is able thanks to them look at its own potential development, precede threats and take advantage of the occasions which might arise in the future the best.

This theses devotes especially to prognostic methods. The main topic is then creating of four particular stories which are to outline how a life of a small town Jilemnice, which is considered to be a gate to Krkonoše/Giant mountains and cradle of cross-country skiing, may be developing in following twenty-five years. Briefly it introduces us the town which is the key issue for whole this work. As next we will learn more about prognostic planning and particularly about those which were used in the work or is closely connected with it. Main stress is put on arising stories about the town and its future development which forms itself mainly due to declining or ascending impulsive force.

Key words: Jilemnice, prognostication, scientific prediction of future, scenarios, brainstorming, SWOT, future, stories
