

Abstract

The aim of my bachelor thesis is to describe the whole very difficult pathway of women with breast cancer diagnosis. The diagnosis which nobody wants to hear. I have found a lot of thesis about radiotherapy, about chemotherapy, about surgical themes or psychological problems associated with treatment. However, the breast cancer is so complex disease, which can affect lymphatic system, skeletal system, brain, lungs or liver, that it is impossible to divide phases of therapy. We can say with a little hyperbole that one doctor is no doctor. Multidisciplinary care and treatment is absolutely necessary, something, what we can't overview, because surgeon or oncologist without pathologist or radiologist is like a paraplegic.

The thesis is divided into chapters, every chapter characterizes one phase of treatment and describes cure process of patient with special type of breast cancer – triple negative carcinom. The thesis focus on the description of the breast cancer diagnosis, its risk factors, epidemiology and describe treatment and nursing care through the whole spectrum of therapy. There is theoretical basis, multidisciplinary team decisions, psychological frame and main nursing diagnosis of appropriate phase of treatment in the each chapter.

In the end of thesis is, beyond the description of follow-up, prognosis of patient with breast cancer and importance of multidisciplinary team, also vision of another step in nursing care of women with breast cancer diagnosis – description of specialist Breast Care Nurse.
