

Abstract

This bachelor thesis deals with the relation of emotional ties, empathy and the burnout syndrome among health care personnel. And at the same time this thesis deals with the relationships between them with each other. The work is composed of two parts. The first part is theoretical, where the burnout syndrome, empathy and emotional attachment is characterized. The second part is devoted to the empiric research. This includes the results from the questionnaires that were filled in by a medical personnel. In the first of the questionnaire is examined the burnout syndrome using the Copenhagen Burnout Inventory (CBI) for health personnel. In the next questionnaire, the Interpersonal Reactivity Index (IRI) is explored empathy and the Experiences in Close Relationships- Relationship Structures (ECR-RS) is about exploring avoidance and anxiety in relation to partner, friend and parents, mother and father. The content of the questionnaire investigation is inherently anamnestic questionnaire and informed consent. Anamnestic questionnaire is used for the processing of demographic data. All the results from the empirical research are included in the tables and graphs. A fully summary is in the discussion and in the final of bachelor thesis.
