

After spinal cord injury occur a lot of complication, with resulting from neurological picture. These can be central, peripheral or mix paresis in some cases even plegie. Often an autonomic nervous system can be damaged, causing complication practice in nearly all body systems. Rehabilitation attend belongs to basic care of paretic patients and is closely connected with basic with basic nursing methods from which the physiotherapy of these patients arise. This survey gives a summary of procedures and methods of physiotherapy , which help the patient to prevent and better respond to the complication treatment e.g. on respiratory and movement apparatus. Complex physiotherapeutic treatment concentrates mainly on prevention of complications.

The physiotherapist must anticipate formation of complications and adapt the complexity of the treatment.
